Mon-Gel

Mon-Gel is a unique, highly dispersible, blend of polymers engineered to provide both low and high-end rheology, for all water-based fluids, while minimizing product losses.

Optimum properties are provided without the costly loss of time and product that occurs with most polymers. Many companies use more expensive, 35-40% active, liquid polymers to increase hydratability and thereby avoid costly loss of polymers. The immediate and total hydration of the dispersible Mon-Gel polymer blend minimizes mixing problems and provides broad spectrum rheology at minimum concentration and cost. This one package product is ideal for operations such as coil tubing, diamond drilling and shallow drilling core holes where it is essential to minimize inventory and cost.

| Technical Data | Typical Properties |
|-----------------------|-------------------------|
| Appearance | Solid |
| Color | Tan |
| Specific Gravity | Not available |
| Solubility in water | Soluble |
| Dosage recommendation | 1 – 5 kg/m ³ |

Packaging: 25 kg bags

Multipurpose product, For all types of water, Quicker viscosity response, Broad spectrum rheology,
Lower product cost minimal inventory, Less mixing time, Total hydration, Minimal product loss,
Lower concentrations, Enhanced suspension and hole cleaning, Environmentally friendly.
